# 2025 Email Security Cheat Sheet

Is your business's email environment  
*really* protected?

[www.metrofile.com/cloud](http://www.metrofile.com/cloud)

# 94%

of all  
malware and

# 96%

of all social engineering  
attacks today are  
delivered through email.

# Ask Yourself These Questions

Do you receive spam or suspicious emails?

Have you experienced or come close to falling for phishing attempts?

Do you use any protection beyond your email provider's basic spam filter?

Does your current solution scan attachments and links for threats before they reach your inbox?

Does your current solution detect and block unknown and advanced email threats?

Today's email threats are more advanced, evasive, and harder to detect - from phishing and zero-day malware to business email compromise (BEC).

Use this cheat sheet to assess your business's email security solution and see where you need to fill the gaps.

# Your Email Security Solution Should:

## **Block threats before they reach inboxes**

Prevent email attacks before users ever see them.

## **Stop phishing and spoofing**

Use threat intel, URL checks, image analysis, and DMARC tools.

## **Detect hidden and evasive threats**

Unpack files and URLs, and scan email content.

## **Prevent APTs and zero-days**

Block advanced exploits before they activate.

## **Avoid delays and false positives**

Detect email threats in under 30 seconds.

Strong email security isn't just about blocking spam - it's about ensuring your business can communicate safely, stay compliant, and respond confidently to incidents.

If even one of these layers is missing, your business may be more vulnerable than you think.

Metrofile Cloud shields your email communication corridors before these threats infiltrate end-users' Microsoft 365, Google Workspace, or any on-premise email server mailboxes.
